

Abstract

Pre-extraction records are often unavailable, leaving clinicians without references for planning full-arch prosthetic rehabilitation. In this case, however, the patient presented edentulous due to drug abuse. Patient provided pre-extraction casts and photos to aid in the design of the final teeth

Initial Presentation

A 46 year-old edentulous male presents seeking fixed solutions.
 CC: “I had a really nice smile, and I would love to have my smile back”
 Patient provided pre-extraction records post orthodontics treatment, which included photos and casts

Treatment Plan

- Records were digitized
- PIC scan and IOS were taken
- Prototypes were designed to match the patient’s digitized records
- Final prostheses followed the prototypes
